**SUPPLEMENTARY INFORMATION:**

**I. Abstract**

This request is for a new information collection.

Marine recreational anglers are surveyed to collect catch and effort data, fish biology data, and angler socioeconomic characteristics. These data are required to carry out provisions of the Magnuson-Stevens Fishery Conservation and Management Act (16 U.S.C. 1801 et seq.), as amended, regarding conservation and management of fishery resources.

Marine recreational fishing catch and effort data are collected through a combination of mail surveys, telephone surveys and on-site intercept surveys with recreational anglers. Amendments to the Magnuson-Stevens Fishery Conservation and Management Act (MSA) require the development of an improved data collection program for recreational fisheries. To meet these requirements, NOAA Fisheries has designed and tested new approaches for sampling and surveying recreational anglers.

A mail survey of all anglers within a household will be used to collect recent fishing effort data including gear and methods of fishing from shore. The main purpose will be to compare to on-site roving counts of shore fishing effort during the same period and to produce adjustment factors for under-coverage of the roving on-site survey (the roving effort survey does not require response from the public). The survey scope is Oahu, during a single 2-month sampling wave (current schedule July-Aug, 2014). The

effort surveys will use catch data from the ongoing shore angler intercept survey to produce estimates of total catch, harvested catch, and live released catch.

## **II. Method of Collection**
