k. Description of Request: The licensee requests a temporary variance of its minimum flow requirements in the East Fork of the Russian River. Due to seismic risk at Scott Dam, the licensee does not intend to close the dam's gates, reducing the storage capacity in Lake Pillsbury by approximately 20,000 acre-feet. The licensee proposes to reclassify the water year type to reduce flow releases to Eel River below Scott Dam from the current normal water year requirement of 60 cfs to a critical water year flow floor set by the minimum opening of the low-level outlet of approximately 20 cubic feet per second (cfs). Minimum flows into the Eel River below Cape Horn Dam would be 15 cfs, consistent with a wet water year classification. Minimum flow releases to the East Fork of the Russian River would be reduced from normal water year requirements of 75 cfs to 25 cfs, as required during a dry water year, but the proposed variance includes the flexibility to adjust these flows to critically dry year releases of 5 cfs if daily average Lake Pillsbury release water temperatures at gage E-2 exceed 16 degrees Celsius or as needed to maintain the reservoir elevation for facility safety. The licensee additionally requests that compliance with flow requirements to the Eel River below Cape Horn Dam be measured as a 24-hour average versus instantaneously to allow for a tighter compliance buffer. The request includes provisions for water temperature monitoring and monthly consultation throughout implementation of the proposed variance. The licensee requests that the variance would begin immediately upon Commission approval and conclude when Lake Pillsbury storage exceeds 36,000 acre-feet following October 1, 2022 or is superseded by another variance. The licensee states it is also developing a proposal for Commission approval, for a long-term flow regime to assure compliance of environmental requirements with the spill gates remaining open.
